Subject: EUDR Supplier Audit Report

Dear Valued Customers of H.V. Fila Co., Ltd

H.V. Fila Co., Ltd is a rubber thread and related rubber products producer located at 119/9 Moo 1, Sethakit 1 Rd., Baan-koh, Muang 7400, Samut Sakhon, Thailand. Natural rubber is a primary raw material used in the company's production, which is sourced from the domestic supply base area.

Agrodominant Co., Ltd. has conducted a EUDR Supplier Audit across the entire H.V. Fila Co., Ltd supply chain between 22nd April 2026 – 18th June 2026, the audit was based on a desk-based review, onsite audit and remote sensing techniques, including QGIS and satellite imagery. Sampling was conducted using a risk-based approach. The audit resulted confirming that the company EUDR system is operational and effective.

The assessment concluded that there is a negligible risk of non-compliance with national legislation across the entire supply chain. In addition, a robust system is in place to ensure compliance with the EUDR, supported by comprehensive traceability and segregation mechanisms.

We are pleased to submit this EUDR Supplier Audit Report for your review and consideration, and to provide preliminary recommendations for further action.

Sincerely,

(Mr. Somporn Khongtanakrittakorn)
Managing Director

EUDR SUPPLIER AUDIT REPORT

H.V. FILA CO., LTD
(119/9 Moo 1, Sethakit 1 Rd., Baan-koh, Muang 7400,
Samut Sakhon, Thailand)

Commodity: Natural Rubber (Rubber Thread)

EXCLUSIVE SUMMARY

This report presents the results of the EUDR supplier audit conducted to evaluate H.V. Fila Co., Ltd's compliance with the EU Deforestation Regulation (EUDR) requirements. The system was independently audited by Agrodominant Co., Ltd. between 22nd April 2026 – 18th June 2026. The audit was based on a desk-based review, onsite audit and remote sensing techniques, including QGIS and satellite imagery. Sampling was conducted using a risk-based approach along the company supply chain.

The findings confirm that the company has implemented a robust chain of custody and due diligence system across its rubber thread supply chain, addressing all key regulatory requirements.

A comprehensive system is in place covering geolocation, deforestation-free verification, legality assessment, and third-party certification to ensure compliance and effective risk mitigation. For geolocation and traceability, spatial data for all production plots is collected in line with EUDR Articles 9(1)(d), 9(1)(e), and Article 2, supported by a structured traceability system.

For [deforestation-free due diligence](#), spatial datasets such as forest layer and protected areas, and national parks are integrated into QGIS to support assessment processes. While natural latex sourcing is primarily from agricultural land converted prior to or in line with the 31 December 2020 cut-off date, geospatial analysis identified some plots within forest-classified areas. For privately owned lands, deforestation-free status is verified through land title documents issued before the cut-off date, while post-cut-off titles are excluded from EUDR compliance. The national forest definition and the forest layer used for deforestation-free due diligence are not fully aligned with the EUDR and are currently treated as a specified risk. However, this forest layer can also be used as the best available source to reduce the risk to “low risk.”

For [legality due diligence](#), all eight categories of relevant legislation under the EUDR were assessed using a risk-based approach supported by verifiable information. Both the company and its suppliers demonstrate compliance, with all categories assessed as “Low Risk”.

For [third-party review and segregation](#), valid Supply Base and Chain of Custody certifications are maintained by both the company and its suppliers, ensuring integrity, transparency, and segregation across the supply chain, and this categories assessed as “Low Risk”.

Overall, the assessment confirms that the company has implemented appropriate mitigation measures, certification systems, and traceability controls to support EUDR compliance, with all identified risks effectively managed to a Low Risk level.

OVERVIEW

Description of the company

H.V. FILA CO., LTD. is a manufacturer specializing in the production of natural rubber thread and related rubber products. Established as part of the H.V. Group, the company leverages Thailand's abundant natural rubber resources to deliver reliable and innovative solutions to customers worldwide.

The company has achieved certification to ISO 9001:2015 for quality management. The company has also demonstrated an ongoing commitment to sustainability and environmentally responsible production practices.

The company currently maintains active Forest Stewardship Council (FSC) Chain of Custody (CoC) certificate with the license number FSC-C219898. The company's EUDR system and Due Diligence System (DDS) have been implemented to ensure that all raw materials are sourced from legal origins and that robust control measures are in place to prevent legally harvested materials from being mixed with materials from unknown or non-compliant sources during processing, transportation, and trade.

The company primarily utilizes natural latex from Rubber tree species (*Hevea brasiliensis*) as a secure and sustainable source of raw material for the production of rubber thread and related rubber products.

EUDR-compliant pulp and papers system

In response to the EUDR, H.V. FILA CO., LTD. has developed an EUDR system to ensure that rubber thread and related rubber products can be traced to the plot of land on which they were produced, and that their production complied with Thai law and did not result in deforestation. The system makes sure that the criteria for deforestation-free and legally produced products under Article 3 of the EUDR are satisfied. The objective of the system is to produce "EUDR-compliant rubber thread and related rubber products" meaning the products that Operators recognize as deforestation-free and legally produced.

The system consists of four key components:

1. Geolocation and traceability
2. Deforestation-free due diligence
3. Legality due diligence
4. Third-party review & Segregation

The system was independently audited by Agrodominant Co., Ltd. between 22nd April 2026 – 18th June 2026, confirming that it is operational and effective. The audit was based on a desk-based review, onsite audit and remote sensing techniques, including QGIS and satellite imagery. Sampling was conducted using a risk-based approach.

Description of the Chain of Custody and Upstream Supply Chain

It should be noted that Thailand is classified as a low-risk country under the benchmarking system established pursuant to Article 29 of the EUDR. Accordingly, Operators sourcing from low-risk countries are not required to conduct risk assessments (EUDR, Article 10) or implement risk mitigation measures (EUDR, Article 11), provided that they have assessed the complexity of the relevant supply chain, as well as the risks of circumvention of the Regulation and mixing with products of unknown origin, in accordance with Article 13(1), and have concluded that the risk is negligible.

Under the EUDR framework, the upstream supply chain and chain-of-custody system of H.V. FILA CO., LTD are illustrated in the diagram below.

Figure 1: H.V. FILA CO., LTD's supply chain mapping

The company's supply chain is categorized into four segments under a single chain-of-custody system. The details are summarized as follows:

1. **Primary raw materials** are sourced from private and public lands that are authorized for cultivation, harvesting, processing, and transport. The raw materials consist of natural latex from *Hevea brasiliensis*, sourced from both Forest Stewardship Council (FSC)-certified plantations and non-Forest Stewardship Council (FSC)-certified plantations.
2. **Semi-finished products**, specifically concentrate latex are sourced from from both Forest Stewardship Council (FSC)- CoC certified and non-Forest Stewardship Council (FSC)- CoC certified suppliers.

3. **Processing activities** are carried out at company-owned facilities under the Forest Stewardship Council (FSC)- CoC valid licenses and in compliance with national legislation.
4. **Trading and export activities** cover the supply of domestic and international markets. European Union countries are also destinations for the company's products. Within the EU market, the company's role is classified as supplier based.

ASSESSMENT OF EUDR & DUE DILIGENCE SYSTEM

1. Geolocation and traceability

As mentioned above, the EUDR requires Operators to collect geolocation information for all plots of land where the commodities contained in, or used to make, the relevant product were produced, as well as the date or time range of production (EUDR, Article 9(d)). Products derived from land that has been subject to deforestation or forest degradation after 31 December 2020 (the cut-off date) are not permitted on the EU market.

Although the EUDR does not explicitly use the term “traceability” as a standalone requirement, Operators must be able to trace the product—in this case, *Hevea brasiliensis*. —to the plot of land on which it was produced. This requires that geolocation and production data are transferred throughout the value chain to the Operator, and that product integrity is maintained. In other words, the Operator must be confident that the product has not been mixed with similar products for which no production information is available.

The assessment results of the process for collecting geolocation data, along with the necessary information required to evaluate the legal compliance of each plantation plot intended for harvesting and transport into the company's production process, are presented below

Table 1: Geolocation and traceability

EUDR requirements	Justifications	Risk Rating
Geolocation coordinates for all plots of land where the relevant commodities were produced (mandatory use of polygons for plots larger than 4 hectares, and single latitude and longitude points for plots smaller than 4 hectares) (Articles 9(1)(d) and 2).	The company requires suppliers to provide polygon-based geolocation data, and it also captures and develops its own plantation polygons using QGIS. All production plots are mapped using polygons or multi-polygons, as appropriate. Geolocation coordinates for all production plots are maintained and managed in a system that links each	Specified Risk

	plot to specific production lots, thereby ensuring a robust traceability system in line with the requirement for geolocation data under Articles 9(1)(d) and 2. The assessment results show that non-productive areas, including roads, water catchments, areas allocated to other commodities (such as palm), and residential structures, were identified within the polygons, resulting in this requirement being rated as a specified risk (Figure 2).	
Date or time range of production (Article 9(1)(d)).	As part of the purchasing process, the company requires suppliers to provide information on when their plantations were established and when the rubber trees were planted. This information is integrated into the GeoJSON file for each plot, covering both supplier and company-owned plantations.	Low Risk
Last supplier information (Article 9(1)(e)).	The company requires suppliers to provide information on the current landowner, as specified in the land title document. However, in cases where the land is rented, a lease agreement or power of attorney is required as a mitigation measure to verify the last supplier information. This information is integrated into the GeoJSON file for each plot, covering both supplier and company-owned plantations.	Low Risk

Figure 2: H.V. FILA CO., LTD.'s polygon with the water catchments and other commodities (such as palm)

2. Deforestation-free due diligence

The EUDR defines “forest” and other land categories using internationally accepted standards. These definitions are those that Operators must apply when assessing whether a plot of land was classified as forest at the EUDR cut-off date. For national systems and datasets to be useful to Operators in the exercise of due diligence, they should ideally align with the definitions set out in the EUDR.

The EUDR requires proof of deforestation-free status for all plots obtained after 31 December 2020 (cut-off date) through spatial information derived from Earth observation technologies and Global Positioning System (GPS) data. These technologies play a key role in Operators’ due diligence processes and in the controls carried out by EU Member State competent authorities.

The assessment results of the deforestation-free due diligence process for the company’s rubber tree plots, including both company-owned and supplier-managed areas, are presented below.

Table 2: Deforestation-free due diligence

EUDR requirements	Justifications	Risk Rating
Forest definition (FAO): Land of more than 0.5 hectares, with trees higher than 5 metres and a canopy cover of more than 10 per cent, or trees able to reach these thresholds in situ, excluding	The company uses spatial datasets, including shapefiles of forests 2020 obtained from the Royal Forest Department, including the national park, and wildlife hunting prohibition areas to demonstrate that all sample rubber plantation	Low Risk

land that is predominantly under agricultural or urban land use (Article 2(2)).	plots are not associated with deforestation or forest degradation after the cut-off date of 31 December 2020. These shapefiles are integrated and managed in the company QGIS system (Figure 3). At a more technical level, according to the <i>Study Report on the Use of Computer Techniques for Assessing Forest and Agricultural Land Use Situations and Surveying Deforested Areas Using Remote Sensing Data</i> (2020) by the Royal Forest Department (RFD) of Thailand—which is the source of the forest shapefiles used by the company—“forest” is defined as: “A land area covered by vegetation identifiable as forest trees, forming a continuous patch of not less than 3.125 rai (0.5 hectares). This also includes natural grasslands and rocky areas surrounded by land classified as forest area. It does not include rubber plantations or areas with trees where the primary yield is assessed to be non-timber products, such as agroforestry areas, fruit orchards, rubber plantations, and oil palm plantations.” A 2020 forest cover map was developed based on this definition, using Sentinel-2 and Landsat 8 satellite imagery and primarily visual interpretation techniques. As a result, the forest layer used by the company to demonstrate deforestation-free compliance does not fully align with the definition of “forest” under the EUDR. However, the assessment of all company and supplier plots found that some plots are located within	
--	---	--

	forest areas (Figure 4). In addition, some plots are located within areas classified as forest land. Land acquisition and ownership have been verified through supporting land title documents, including Chanote deeds (Nor Sor 4), Nor Sor 3, Sor Por Kor, Nikom, and Sor Kor–Sor Por Kor documents. These documents demonstrate that the land titles were officially issued prior to the EUDR cut-off date (Figure 5).	
‘Agricultural plantations’ means tree stands in agricultural production systems, such as (...) agroforestry systems (...). Agricultural plantations are excluded from the definition of ‘forest’ (Art 2(3))	The company sources natural latex from land that is originally agricultural land and has later been converted into rubber plantations. Under the EUDR, the classification depends on the land use status at the relevant reference time, in particular the cut-off date of 31 December 2020.	Low Risk
Deforestation definition: conversion of forest to agricultural use, whether human-induced or not (Art. 2 (1))	In Thailand, the clearing or occupation of reserved forest land without authorisation is considered a forest-related offence and is subject to enforcement under the Forest Act and related legislation. Penalties may include fines and imprisonment. Geospatial analysis was conducted using QGIS together with forest shapefiles. Verification confirmed that both company-owned and supplier rubber plots are not located within forest areas prior to purchase. This indicates a very low risk of rubber plantations being established within primary forest areas.	Low Risk

Figure 3: H.V. FILA CO., LTD's deforestation-free due diligence

Figure 4: The H.V. FILA CO., LTD's sample polygons located within the forest areas

Figure 5: The copy of the land title document shows that the land was officially acquired before the cut-off date in the first.

3. Legality due diligence

The European Union Timber Regulation (EUTR) and the European Union Deforestation Regulation (EUDR) require EU Operators to demonstrate that regulated commodities comply with the applicable legislation of the country of production. However, Article 3(2) of the EUDR requires that relevant products be “produced in accordance with the relevant legislation of the country of production”. “Relevant legislation” is defined as the laws applicable in the country of production concerning the legal status of the area or production (Article 2(40)). There are eight categories of relevant legislation for which operators must ensure they have “adequately conclusive and verifiable information”. It should be noted that legality due diligence is a risk-based exercise that may rely on

various types of data and information and does not necessarily require documentary evidence of compliance for all relevant requirements.

The table below outlines eight categories of relevant legislation and summarizes the results of the company's assessment of its supply chain and chain of custody, highlighting their compliance status and the evidence of legal compliance shown in Annex 1.

Table 3: Legality due diligence

Legal Category	Justifications	Risk Rating
Land-use rights	Land Code B.E. 2497 (1954, 1999) : Chanote deed, Nor Sor 4, Nor Sor 3, Sor Por Kor, Nikom, and Sor Kor are types of land under the Land Code. No harvesting or transportation permit is required for <i>Hevea brasiliensis</i>. grown on these types of land. The assessment found that only Chanote deeds (Nor Sor 4) and Sor Por Kor land titles were sourced from the company and its suppliers. Agricultural Land Reform Act B.E. 2518 (1975) : This legislation allows farmers to live on and manage agricultural activities. Sor Por Kor is public land and a type of land title under this law. <i>Hevea brasiliensis</i> is an exotic species and non-restrict species in Thailand. Harvesting and transportation are generally allowed without permission	Low Risk
Environmental protection	Rubber thread and related rubber products manufacturing are classified as facilities required to report Air Pollution Emission (Ror Wor 3) and Water Pollution Discharge Report (Ror Wor 2) under the Enhancement and Conservation of National Environmental Quality Act B.E. 2535 (1992). Authorities inspect air emissions through annual reports (Ror Wor 3), on-site factory inspections, and accredited laboratory testing using standard methods such as isokinetic sampling. If emissions exceed the legal limits, factories may be required to implement corrective actions or temporarily suspend operations. Non-compliance, including failure to submit or incorrect	Low Risk

	reporting, may result in fines under the Factory Act, up to 20,000 THB. As a result of the assessment, the company and suppliers in the supply chain prepare and submit the Air Pollution Emission Report (Form Ror Wor 3) and Water Pollution Discharge Report (Ror Wor 2), also maintain proper records. Waste in plantations in the supply base areas consists mainly of general waste and recyclable materials such as food and beverage containers. There are no chemical containers. Waste is collected and disposed of in community bins and managed by the local administrative organization (Subdistrict Administrative Organization, SAO). Also, factory level waste in suppliers' facilities within the supply base areas is categorized into general waste, recyclable materials such as food and beverage containers, and industrial waste. General waste and recyclable materials are managed by the local administrative organization (Subdistrict Administrative Organization, SAO), while industrial waste is managed by licensed buyers in accordance with the Factory Act B.E. 2535 (1992)	
Forest-related and biodiversity conservation.	The Timber Processing Permit for 13 species is not required for the rubber thread and related rubber production Geospatial analysis was conducted using QGIS with the forest shapefile. Verification confirmed that the company and suppliers plots are not located within forest areas. This means that there is a very low risk of rubber plantations being located within primary forests. In addition, the land acquisition has been verified through copies of land title documents (Chanode deed or Nor Sor 4, Nor	Low Risk

	Sor 3, Sor Por Khor, Nikom, and Sor Khor – Sor Por Khor), which show that the titles were officially issued before 2008. National Park Act B.E. 2504 (1961): The geolocation of the company and suppliers plots have been checked using QGIS with the National Park shapefile. The results show that no plots are located within National Park areas. National Forest Reserves Act (No. 3) B.E. 2528 (1985) : In Thailand, the growing, harvesting, and transportation of <i>Hevea brasiliensis</i>. in National Forest Reserves require specific permits. However, according the the assessment result, the company and supplier rubber plots are not located within National Forest Reserves. Factory Act BE 2535 (1992) : Factories with more than 50 horsepower (HP) are required to have a factory permit. The company has more than 50 HP and found to be operating with a valid factory permit (Ror Ngor 4) during the assesement. Wetlands: Thailand currently has 14 sites designated as Wetlands of International Importance, covering a total area of 399,714 hectares. Within the company's supply base, three sites were identified: Kuan Ki Sian of Thale Noi (Songkhla), Hat Chao Mai Marine National Park (Trang), and the Ko Kra Archipelago (Nakhon Si Thammarat). All of these are protected areas, and relevant legislation is in place and enforced by the competent authorities. According to the results of the assessment, the company and its supply base areas are not located within these areas.	
--	---	--

	Peatlands: Geospatial analysis was conducted using https://www.globalforestwatch.org. The company and supplier plots were verified and found not to be located within these peatlands. Highly biodiverse grasslands: Highly biodiverse grasslands in Thailand are found in mixed deciduous forests and montane areas. These areas are located within national parks, wildlife sanctuaries, and non-hunting areas. These habitats support rare wildlife and endemic plant species. Key sites include Doi Inthanon and Doi Pui (Chiang Mai), Khao Krachom (Ratchaburi, a possible OECM area), Phu Hin Rong Kla (Phitsanulok/Phetchabun), Huai Kha Khaeng Wildlife Sanctuary (Uthai Thani), and Thung Kamang in Phu Khiao Wildlife Sanctuary (Chaiyaphum). Geospatial analysis was conducted using QGIS with the wildlife sanctuaries shapefile. The company and suppliers plots were verified and found not to be located within these wildlife sanctuaries. Hazardous Substances Act B.E. 2535 (1992): The law empowers the government to strictly control hazardous substances throughout their entire lifecycle, including production, import, use, storage, and disposal. All operators handling hazardous substances, especially higher-risk categories, are required to comply with detailed regulatory requirements to protect human health, property, and the environment. Based on the assessemnt, prohibited chemicals (chlordimeform,	
--	--	--

	leptophos, DDT) are not used within the supply base, either in rubber processing or at the plantation level.	
Third parties' rights	The company and its suppliers source <i>Hevea brasiliensis</i>. only from areas supported by legally recognized land title documents, including Chanote (Nor Sor 4), Nor Sor 3, Sor Por Kor, Nikom, and Sor Kor 1 / Sor Por Kor. These areas are not identified as indigenous peoples' settlements, as Indigenous Peoples in Thailand are generally associated with forest areas. Verification using QGIS and spatial data layers for indigenous peoples' areas confirmed that none of the sampled rubber plantations are located within indigenous peoples' areas. The complaint records and stakeholder consultation records have not identified any issues related to legal, customary, or traditional tenure and use rights of Indigenous Peoples and local communities in the company's supply base areas.	
Labour rights	Labour Protection Act B.E. 2541 (1998): The Employment and Working Conditions Form (Kor Ror 11), worker interviews, and complaint records are sufficient information sources for the implementation of this regulation. As a result of the assessment, no child labor below the minimum age specified in Kor Ror 11 was found (below 15 years). Forced and compulsory labor, discrimination in employment and occupation, and freedom of association and the effective right to collective bargaining were assessed through worker interviews and complaint records. According to the Labour Protection Act B.E. 2541 (1998), employers with 50 or more employees are required to establish a Workplace Welfare Committee. The committee must consist of at least five	Low Risk

	members elected by employees to jointly consult and oversee employee welfare matters together with the employer. Meetings between both parties must be held at least once every three months. Main duties are to consult with the employer on welfare matters, provide recommendations on welfare improvements, and monitor and review the implementation of employee welfare arrangements. The company and the supplier appointed the Workplace Welfare Committee in accordance with this regulation.. According to the Labour Protection Act B.E. 2541 (1998) (and its amendments), employers are strictly prohibited from employing children under 15 years of age in any form of work in order to prevent child labour and protect children's rights. Violations are subject to both imprisonment and fines. For workers aged 15 to under 18 years, employment is permitted under specific conditions, including notification to the labour inspector within 15 days of commencement of employment and restrictions on hazardous work or working hours as prescribed by law. The results of the assesement shown that the Workplace Employment and Working Conditions Form (Kor.Ror.11) confirms that the company and suppliers comply with the minimum employment age requirement of not less than 15 years. This is further supported by sample records, including job application forms, copies of national ID cards, and the company employee register. In addition, workplace observations found no workers aged 15 to under 18 engaged in hazardous work. In this regard, the conclusion of this criterion is low risk.	
--	---	--

	According to the Labour Protection Act B.E. 2541 (1998), the minimum labour standards are as follows: working hours are generally not more than 8 hours per day or as prescribed by ministerial regulations; employees are entitled to at least 1 rest day per week; sick leave is granted as medically necessary (with paid sick leave not exceeding 30 days); and annual leave must be at least 6 working days per year after completing one year of employment. According to assessment, the company and suppliers' Employment and Working Conditions Form (Kor.Ror.11) and employee time sheets show that working hours are in accordance with the Labour Protection Act B.E. 2541 (1998). Based on assessment results, safeguards to protect workers' health and safety are implemented through compliance with relevant Thai legislation, including the Labour Protection Act B.E. 2541 (1998), the Occupational Safety, Health and Environment Act B.E. 2554 (2011), and the Hazardous Substances Act B.E. 2535 (1992). However, all company suppliers have fully established and implemented the required policies and procedures in place, including safety training, provision of personal protective equipment (PPE), fire evacuation training, and safety signage. In addition, controls over hazardous substances are implemented, and no prohibited chemicals are used in the supply base areas.	
Human rights protected under international law	The Labour Protection Act B.E. 2541 (1998) (as amended), migrant workers are entitled to the same fundamental labour rights and welfare protections as Thai workers without discrimination. Employers must ensure equal treatment in employment conditions, wages, and welfare benefits for work of equal value,	Low Risk

	regardless of nationality, race, gender, religion, disability, or age. Any form of unequal treatment based on personal characteristics is strictly prohibited under the law. According to assessment results, all company suppliers provide basic Social Security and Workmen's Compensation coverage for all employees in accordance with the Social Security Act B.E. 2533 (1990) and the Workmen's Compensation Act B.E. 2537 (1994), covering both Thai and migrant workers without discrimination, in line with the Labour Protection Act B.E. 2541 (1998). In this regard, the conclusion of this criterion is low risk. According to the Labour Protection Act B.E. 2541 (1998), forced labour refers to any situation in which an employer compels an employee to work against their will. Employers are prohibited from threatening, confiscating important documents, or detaining workers in order to force them to work. The law also establishes minimum labour standards to protect employees' rights and prevent human rights violations. The Labour Protection Act B.E. 2541 (1998) (as amended), migrant workers are entitled to the same fundamental labour rights and welfare protections as Thai workers without discrimination. Employers must ensure equal treatment in employment conditions, wages, and welfare benefits for work of equal value, regardless of nationality, race, gender, religion, disability, or age. Any form of unequal treatment based on personal characteristics is strictly prohibited under the law. The management of grievances and labour disputes in Thailand is governed under the Labour Protection Act B.E. 2541	
--	--	--

	(1998) (as amended), which emphasizes fairness, negotiation, and mediation prior to legal proceedings. Employers are required to establish workplace regulations that clearly define grievance procedures, enabling employees to raise concerns or complaints without fear of retaliation. In cases of complaints such as unfair dismissal, harassment, or non-compliance with statutory welfare requirements, employers must conduct fair and impartial investigations. If disputes cannot be resolved internally, employees have the right to file a complaint with the labour inspector. According to assessment results, the company and suppliers have established complaint mechanisms (grievance procedures) and maintain related records in place. According to the Labour Protection Act B.E. 2541 (1998) (as amended), employers are prohibited from engaging in unfair discrimination against employees on the basis of gender, race, nationality, religion, or age. This includes unequal treatment between male and female employees in terms of employment conditions, wages, or welfare benefits, which are fundamental rights enforced by law. Employers must ensure equal treatment of male and female employees in employment practices. Where the nature of work is the same or of equal value, wages, welfare, and other benefits must also be equal. Discrimination based on personal characteristics such as race, nationality, disability, or age is strictly prohibited. The law also ensures that both Thai and migrant workers are entitled to equal basic labour rights. Any violation of non-discrimination principles is considered an offence under labour protection	
--	---	--

	law and may be subject to penalties as prescribed in the penalty provisions of the Act. According to assessment results, all company suppliers comply with non-discrimination requirements. Complaint mechanisms and records have not identified any issues related to discrimination. Training records also indicate that both male and female employees are treated equally. In this regard, the conclusion of this criterion is low risk. According to the Labour Protection Act B.E. 2541 (1998) (as amended), employers are prohibited from engaging in unfair discrimination against employees on the basis of gender, race, nationality, religion, or age. This includes unequal treatment between male and female employees in terms of employment conditions, wages, or welfare benefits, which are fundamental rights enforced by law. Employers must ensure equal treatment of male and female employees in employment practices. Where the nature of work is the same or of equal value, wages, welfare, and other benefits must also be equal. Discrimination based on personal characteristics such as race, nationality, disability, or age is strictly prohibited. The law also ensures that both Thai and migrant workers are entitled to equal basic labour rights. Any violation of non-discrimination principles is considered an offence under labour protection law and may be subject to penalties as prescribed in the penalty provisions of the Act. According to the assessment results, the company and suppliers comply with non-discrimination requirements. Complaint mechanisms and records have not identified any issues related to discrimination. Training records also indicate that both male and female	
--	---	--

	employees are treated equally. In this regard, the conclusion of this criterion is low risk.	
The principle of Free, Prior and informed Consent (FPIC), including as set out in the United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP)	Free, Prior and Informed Consent (FPIC) is not explicitly established as a standalone legal requirement under Thai law. However, there are constitutional provisions and related laws in Thailand that require respect for individual rights, as stipulated in the Constitution of the Kingdom of Thailand. The company and its suppliers source <i>Hevea brasiliensis</i> only from areas supported by legally recognized land title documents, including Chanote (Nor Sor 4), Nor Sor 3, Sor Por Kor, Nikom, and Sor Kor 1 / Sor Por Kor. These areas are not identified as indigenous peoples' settlements, as Indigenous Peoples in Thailand are generally associated with forest areas. Verification using QGIS and spatial data layers for indigenous peoples' areas confirmed that none of the sampled rubber plantations are located within indigenous peoples' areas. The complaint records and stakeholder consultation records have not identified any issues related to legal, customary, or traditional tenure and use rights of Indigenous Peoples and local communities in the company's supply base areas.	
Tax, anti-corruption, trade and customs regulations	The Revenue Code : The company's suppliers whose annual income exceeds 1.8 billion THB are required to apply for a Value Added Tax (VAT) certificate, and withholding tax must be applied to all supplier tax invoices and submitted to the Revenue Department monthly. The Value Added Tax (VAT) certificate and withholding tax records were found during the assessment. In Thailand, land is classified into private land and public or government land. The land which is recognized by the Land Coded B.E. 2497	Low Risk

	(1954) is not considered as forest under the Forest Act B.E. 2484 (1941) and they are classified as a private land - and all timber species on private land are unrestricted species which is a free for harvesting, transporting, and trading according to the Forest Act B.E. 2484 (1941), amended B.E. 2562 (2019), section 7. On the other hand, other types of land are classified as public land where the harvesting permit is required for all restricted species, regardless of whether they are planted or from a natural forest. <i>Hevea brasiliensis</i>. is an exotic species and is not restricted in Thailand. Harvesting and transport are generally allowed without any permission and payment. A royalty must be paid for all species that require a harvesting permit, except for natural latex (<i>Hevea brasiliensis</i>) grown on private land. The income and value added taxes (VAT) are regulated in the Revenue Code, but there is no specific legislation covering sale taxes on profits derived from sale of timber and forest products and harvesting activities. VAT is a sale tax on each stage of production and distribution. Any person or entity with annual turnover exceeding 1.8 million THB is subject to VAT. Those eligible must register to be a VAT-registered person or entity. Timber, wood and wood-related products are not exempt from VAT and are subject to VAT of 7%. A VAT registered person or entity is required to issue tax invoice every time transactions are made, showing details of the amount of VAT due. The company's suppliers whose annual income exceeds 1.8 billion THB are required to apply for a Value Added Tax (VAT) certificate, and withholding tax must be applied to all supplier tax invoices and submitted to the Revenue Department monthly. The Value Added Tax (VAT) certificate and withholding tax records were found during assessment. The company and the supplier have policies and implementation measures for the anti-corruption mechanism.

4. Third-party review & Segregation

Transparency and third-party review are not direct requirements of the EUDR. However, Article 10(n) refers to complementary information on compliance with this Regulation, which may include information provided through certification schemes or other third-party verified schemes, including voluntary schemes recognised by the Commission under Article 30(5) of Directive (EU) 2018/2001 of the European Parliament and of the Council, provided that such information meets the requirements set out in Article 9 of this Regulation. Therefore, certification or other third-party verification may be considered as part of the risk assessment process.

On the other hand, segregation is also important to prevent contamination through mixing with relevant products of unknown origin or products produced in areas where deforestation or forest degradation has occurred, as prescribed in Article 10(j). Therefore, the assessment also focuses on integrity, transparency, and segregation based on a review of the certificates and third-party reviews.

According to the assessment results, the company holds a valid Forest Stewardship Council (FSC) Chain of Custody (CoC) certificate with the license number FSC-C219898 to ensure integrity, transparency, and proper segregation are in place. In addition, all suppliers within the company's value chain also hold valid Supply Base and Chain of Custody certifications for both domestic and imported raw material sources, as shown in the table below.

RISK MITIGATION

According to the Article 11 (1) Operators cannot proceed with marketing or exporting products if there is more than a negligible risk of non-compliance; they must first take effective measures to reduce that risk to a negligible level or "Low Risk".

The assessment found one identified risks in the H.V. FILA CO., LTD's supply chain, requiring mitigation measures to reduce them to a low level. The company mitigation measures and results are as following.

Specified Risk # 1
Aspect
Geolocation and traceability
Description of the specific risk
The assessment results show that non-productive areas, including roads, water catchments, areas allocated to other commodities (such as palm), and residential structures, were identified within the polygons, resulting in this requirement being rated as a specified risk
Mitigation measure

Non-productive areas, including roads, water catchments, and residential structures, are identified and excluded from the defined polygons, and no raw material volumes are calculated from these excluded areas.

Mitigation Result

Low Risk

Mitigation Evidence

CONCLUSION

Conclusion for geolocation and traceability

- The geolocation data collection is in line with the requirements of the EUDR (Articles 9(1)(d) and 2), as well as Article 9(1)(e).
- Geolocation coordinates for all production plots are managed and ensuring a robust traceability system and the non-productive areas, including roads, water catchments, and residential structures are excluded from the polygons.
- The optional properties ProducerName, ProducerCountry, and the ProducePlace as defined in the EUDR GeoJSON File Description Version 1.5 (dated 5 May 2025), are included in the GeoJSON file.

Conclusion for deforestation-free due diligence

- Spatial datasets, including forest shapefiles and protected areas, are integrated and managed in QGIS to support deforestation-free assessments.
- The national forest definition and the forest layer used for verification are not fully aligned with the EUDR and have therefore been identified as a “Specified Risk.” However, this forest layer can still be used as the best available source to support risk assessment and reduce the risk classification to “low risk.”

- *Hevea brasiliensis* sourcing is mainly from agricultural land converted prior to or assessed against the 31 December 2020 cut-off date.
- Geospatial analysis confirms that most plots do not overlap with forest areas; however, some plots are located within forest areas.
- Land tenure is verified through official title documents where relevant, supporting legal compliance and traceability.

Conclusion for Legality due diligence

- The EUDR require operators to ensure that relevant products comply with the applicable legislation of the country of production.
- The assessment covered all eight categories of relevant legislation defined under the EUDR.
- A risk-based due diligence approach was applied using adequately conclusive and verifiable information.
- The company and its suppliers demonstrated compliance with the applicable legal requirements.
- The justification and assessment results for all legal categories were determined to be Low Risk for both the company and its suppliers.

Conclusion for third-party review & segregation

- The company holds valid Supply Base and Chain of Custody forest certifications to ensure proper integrity, transparency, and segregation practices are implemented.
- All suppliers within the company's value chain also maintain valid Supply Base and Chain of Custody certifications for both domestic and imported raw material sources.

ANNEX I: LEGAL COMPLIANCE EVIDENCE

Compliant with the laws of the country of production (Legal Compliance Verification)		
- Production (Chain of Custody #1):	Non FSC (Company A)
